## 2021A13

Level 1: To calculate current, we will use one of the electrical equations:

$$
V=I R
$$

Where $V$ is voltage in volts, I is current in amperes, and $R$ is resistance in ohms $(\Omega)$. Rearrange to solve for current.

$$
\begin{gathered}
I(A)=\frac{V(V)}{R(\Omega)} \\
I=\frac{620 \mathrm{~V}}{24.76 \Omega}=25.04 \mathrm{~A}
\end{gathered}
$$

Level 2: The equation to calculate magnetic field is:

$$
B(T)=\frac{\mu_{0}\left(\frac{T * m}{A}\right) * I(A)}{2 \pi d(m)}
$$

Substitute the given quantities and solve for B.

$$
B=\frac{\left(4 \pi * 10^{-7}\right) \frac{T * m}{A} * 25.04 A}{2 \pi * 1.83 \mathrm{~m}}=9.6 * 10^{-6} \mathrm{~T}
$$

A generator being flown during turbine erection.
